
Analytics for smart water metering

- Cloud based platform for analyzing data
- Intuitive dashboards and detailed overview of the distribution network
- Get a continuous overview of your water loss
- Find leaks in service connections

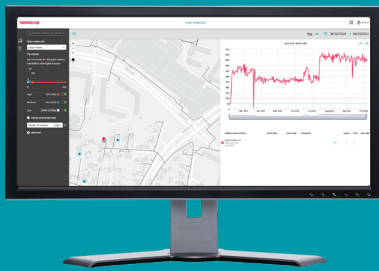

Your analytics toolkit

The value of your smart meter data goes far beyond accurate billing. With the right tools, you can transform your data into actionable insights. Water Intelligence is our analytics platform for smart water metering, and with it you can go from imagining “What if” to knowing “How to”.

Water Intelligence is a cloud-based platform that gives you the knowledge needed to effectively target your efforts. Your meter data is automatically organised, visualised and analysed to give you a total overview of the water loss in your distribution network as well as any high-risk service connections or distribution mains with possible leaks.

Modules in Water Intelligence

Leak Detector enables you to locate leaks in service connections and distribution mains.

District Analyser gives you a continuous overview of the water loss in your individual districts.

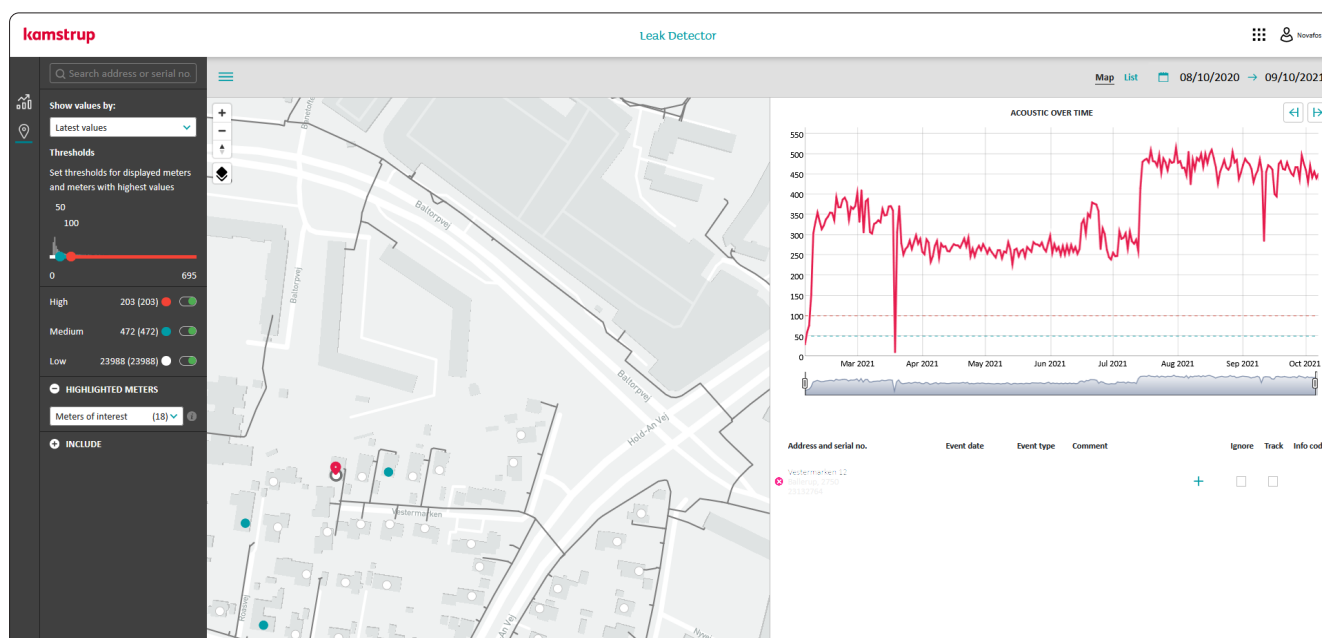

Leak Detector

Leak detection is often a time-consuming, inefficient and expensive task based on a combination of trial and error, theoretical models or gut feelings. But it does not have to be.

Leak Detector enables you to locate leaks in service connections and distribution mains based on acoustic noise levels registered by flowIQ® 2200 water meters. With the systems advanced algorithm and map-based overview, you can easily identify high-risk installations where elevated noise levels indicate possible leaks or bursts.

With a faster and more efficient leak detection, you reduce your cost per identified leak and can find the low-hanging fruits for reducing your non-revenue water. Detailed knowledge about high-risk installations with possible leaks and the overall condition of your network will also enable you to prioritize your daily efforts to when and where they will have the biggest impact.

Map-based overview

The map in Leak Detector shows your meters with intuitive colour coding representing the noise level registered by each meter.

It is also possible to have your pipe network integrated into the map.

Meters of interest

Leak Detector automatically identifies the meters with the highest risk of leakage and marks them as 'meters of interest'. This enables you to target your efforts and gives you an overview of where to take action.

Intuitive filtering

The filtering options let you control which meters are shown on the map so you can identify installations with increased noise levels while graphs visualise how the noise have developed over time.

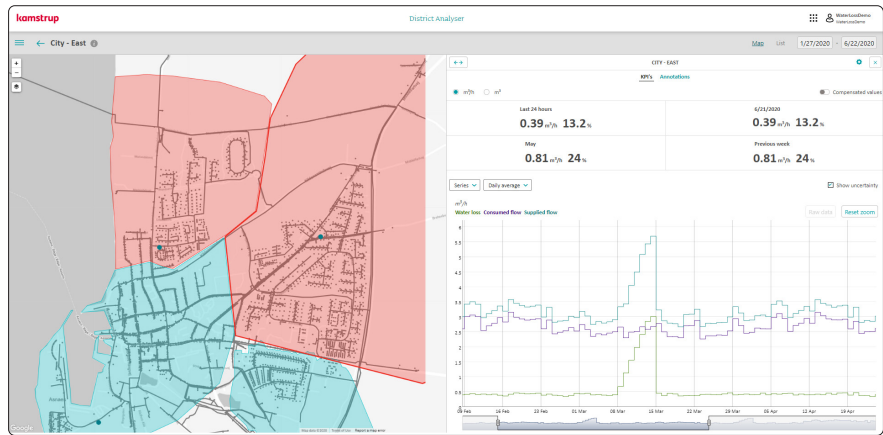

Stay up to date

Receive automated reports that give you an overview of all meters with elevated noise levels or use the Dashboard to stay up to date on the most important findings in Leak Detector.

District Analyser

District Analyser gives you a complete overview of the water loss in your distribution network split into districts. You get a map-based overview of your entire supply area split into districts, with information on the current water loss and intuitive colour-coding that shows the status in each of your districts based on predefined limits.

For each district, you get detailed information on inlet flow, consumption, night flow and water loss letting you follow developments closely, target your efforts and act as soon as the water loss increases in one district.

Water loss visualised by district

A map of your supply area provides a constant overview of the water loss in your entire network.

Intuitive colour coding of your districts immediately shows their status based on your predefined limits for acceptable water loss.

Insight into each individual district

For each of your districts, you can dive into a detailed view of the water loss, supplied volume, consumed volume and night flow.

Choose and switch between views based on data from the last 24 hours, the last 7 days, the last month or specify the exact period.

Follow the development

You can set up KPI's to track how the water loss in a given district develops to quickly get an overview if something is turning for the worse.

KPI's can be defined for each individual district and for the entire distribution network.

Add background info

Adding annotations can assist you in keeping track of events that happen in your distribution network and that can't necessarily be explained based on your data without additional details.

This could be a sudden spike in water loss that was caused by a fire.
